

While I can appreciate the great potential of BPL, it's ultimate potential appears to be providing broadband access to those rural areas unserved by current dsl and cable providers. I have not seen where the current trials have proved that this can be done in an economically feasible manner.

With it's problematic rf emissions, it would appear to be a better solution, if implemented at all, to utilize frequencies not occupied by licensed users. It's my understanding that there are BPL technologies which do just that.

Please consider these two issues before letting this situation loose on America. We have too much at stake to be locked into this technology. Thank you for the opportunity to comment.
